Kaseya 365

16 ESSENTIAL AUTOMATIONS
for Effortless IT Management

Kaseya 365 is a journey of discovering new and easy ways to do the hard IT stuff. It's a one-stop shop for endpoint management, patching, backup and security solutions that are seamlessly unified by automation. You could say that automation is at the heart of Kaseya 365. Think smoother workflows, fewer manual errors and enhanced overall productivity. While Kaseya 365 has many impressive automations that continue to amaze IT professionals, our infographic highlights 16 of the most important ones for achieving top-notch IT service delivery.

AUTOMATION 1
Endpoint Shortcut for EDR

How it works: The integration between Datto RMM and EDR allows instant remote access to an asset when a threat alert is triggered.

Why it's valuable: It reduces the number of clicks needed to move from an alert in EDR to the affected machine, making threat investigation and response faster and easier.

AUTOMATION 2
SmartLook for EDR

How it works: Datto EDR security alerts and data are seamlessly integrated into an out-of-the-box Datto RMM dashboard, alongside other security tools, for complete security monitoring.

Why it's valuable: The integration minimizes the clicks needed to perform basic health checks and security monitoring, while active agents ensure full coverage of a client's environment.

AUTOMATION 3
Endpoint shortcut for antivirus (AV)

How it works: The Datto RMM and AV integration facilitates instant remote access to the machine where a threat is detected, allowing for immediate investigation.

Why it's valuable: It reduces the number of clicks needed to go from a Datto AV alert to the affected machine, speeding up threat verification and response.

AUTOMATION 4
True-Sync for EDR Events

How it works: Datto EDR events are grouped into a single alert and integrated into the main feed of Datto RMM alerts, reducing noise and simplifying the management of EDR events.

Why it's valuable: This integration centralizes alerts into one main module and consolidates events, making management easier and more efficient.

AUTOMATION 5
True-Sync for EDR Policy

How it works: By enabling a built-in policy in Datto RMM, Datto EDR can be deployed to targeted endpoints in seconds. Deep links between the two modules allow users to switch between portals with just one click.

Why it's valuable: This integration quickly protects endpoints and reduces the time needed for EDR deployment.

AUTOMATION 6
True-sync for EDR health status

How it works: You can monitor Datto EDR installation and health status right in VSA 10.

Why it's valuable: This minimizes the clicks needed for basic health checks, making it easy to ensure EDR is running smoothly on all your clients' endpoints.

AUTOMATION 7
True-Sync for organizations

How it works: This integration is automatically activated, making sure your existing site's data from Datto RMM (or VSA) works seamwvwlessly as Datto EDR locations.

Why it's valuable: It speeds up EDR onboarding, simplifies the setup process and ensures your endpoints are protected from the start.

AUTOMATION 8
True sync for AV health status

How it works: This integration adds Datto AV status to Datto RMM or VSA, allowing easy search, filtering and scripting. You can also view installation coverage and health status on a built-in Datto RMM dashboard.

Why it's valuable: It reduces the number of clicks needed for basic health checks, such as ensuring AV is running on all endpoints in a client's environment.

AUTOMATION 9
One-deploy for backup install

How it works: Quickly scale your operations by using an out-of-the-box Datto RMM or VSA component and your endpoint backup for PC license to deploy agents all at once.

Why it's valuable: It significantly cuts down deployment time and ensures your endpoints are protected with antivirus, keeping your systems secure with less hassle.

AUTOMATION 10
One-deploy for patching

How it works: Advanced Software Management controls are built into the Policy Configurator, your main hub for software management, making it easy to manage and patch OS across a targeted or dynamic group of endpoints.

Why it's valuable: This integration reduces the time needed to set up software patching rules during customer onboarding, ensuring consistent software management.

AUTOMATION 11
One-deploy for AV agent install

How it works: By combining an out-of-the-box RMM policy with your Datto AV license, you can quickly and efficiently deploy antivirus agents to multiple endpoints at once.

Why it's valuable: This integration significantly reduces AV deployment time, allowing you to protect all endpoints much faster.

AUTOMATION 12
One-deploy for ransomware detection

How it works: Ransomware detection controls are built into the EDR policy management section, letting you manage ransomware on multiple endpoints at scale.

Why it's valuable: This integration cuts down the time needed to deploy ransomware detection and rollback across all endpoints, reducing the risk of widespread attacks

AUTOMATION 13
One-deploy for RMM ransomware policy

How it works: Ransomware detection controls are built right into the policy configurator, making it easy to manage ransomware across multiple endpoints.

Why it's valuable: This integration saves time by quickly deploying ransomware detection and response to all endpoints.

AUTOMATION 14
One-deploy for RocketCyber

How it works: Combine an out-of-the-box RMM component with your RocketCyber license to deploy agents quickly and efficiently to multiple endpoints.

Why it's valuable: This speeds up endpoint protection and reduces deployment time for RocketCyber.

AUTOMATION 15
One-deploy for RMM 3PP policy (Datto RMM and VSA)

How it works: Third-party patching controls are built into the policy configurator, letting you manage and patch software across multiple endpoints easily to eliminate vulnerabilities.

Why it's valuable: It minimizes the time needed to set up patching rules, making the process more efficient.

AUTOMATION 16
SafeCheck for EDR activity / AV activity

How it works: SafeCheck integrates with Datto EDR to provide more detailed endpoint telemetry data, which the Managed SOC analyzes to improve visibility into endpoint activities.

Why it's valuable: It offers deeper insights into suspicious activities on endpoints, enabling more accurate and timely threat detection and response.

Kaseya 365 has many more automation features to free you from the shackles of mundane tasks and make your life easier.
