Health Check:
Kaseya VSA

Optimize the full value of your VSA investment

You wouldn't let your body go years without a physical exam, would you?

Too many customers run critical systems like Kaseya VSA without conducting annual evaluations. Consequently, your organization may not be taking full advantage of its VSA system capabilities, and productivity slowly starts to lag.

Increase Your Entire VSA Server Functionality

Sign up for a comprehensive VSA Health Check to analyze your entire VSA configuration and identify areas for improved usability and performance.

A Kaseya Professional Service Consultant will remotely conduct the Health Check, which is a thorough technical review of your current Kaseya Environment, configuration, and related processes.

Subsequently, you will receive a comprehensive, step-by-step Health Check report documenting findings, comparing your environment against Kaseya's best practices guidelines, and recommending next steps.

Are You Ready for Your Health Check?

If you've been using VSA for more than two years without any usage evaluation, a VSA Health Check is highly recommended to review your server configuration.

Your customized Health Check can pinpoint the exact reasons for performance issues, as well as the most cost-effective way to reverse them.

Increase Technician Efficiency

In addition, the Health Check will review all aspects of your Kaseya usage and highlight areas where you can increase efficiency by optimizing your use of these capabilities:

- System
- Agents
- Discovery
- Remote Management
- Monitoring
- Patch Management
- Info Center
- Agent Procedures
- Audit

- Policy Management
- Network Monitor
- Service Desk
- Desktop Policy and Management
- Online Backup
- Endpoint Security
- Software Development
- Ticketing
