Subject: Kaseya VSA Incident Impact to Spanning

Kaseya retained Palo Alto Networks Unit 42 to evaluate the impact to Kaseya portfolio products as a result of the recently disclosed vulnerabilities in the Kaseya VSA product. Unit 42 conducted interviews with the appropriate Spanning employees and reviewed evidence detailing the compartmentalization between Spanning's applications, infrastructure, codebase, and environment from Kaseya network and the Kaseya VSA product codebase. Additionally, Unit 42 received a technical briefing from Mandiant, who is currently engaged with Kaseya and assisting with the investigation into the Kaseya VSA incident.

The evaluation identified Spanning does not share applications or codebase with Kaseya VSA and that the Spanning network environment is fully segmented from the Kaseya network environment. Furthermore, Unit 42 understands that the investigation to date has found no evidence that the Kaseya VSA incident extended into the Spanning environment. Based on our review, Unit 42 concludes that the Kaseya VSA incident does not impact the Spanning product or environment.

Unit 42 specializes in data breach response and cyber risk management. Hailing from US government agencies and global security firms, Unit 42 consultants have handled some of the largest breaches in history. Our teams have responded to thousands of security incidents and our risk management solutions are informed by this unparalleled experience.
